

Caleb Elder

706-612-7923 | caleb.elder4@icloud.com | in/calebelder-compsci | github.com/ucgmae47 | Portfolio

Education

University of Georgia

December 2026

3.98 GPA | B.S. Computer Science, Minor in Mathematics

Achievements: Hollingsworth Award in Linear Algebra, Presidential Scholar, Dean's List, Zell Miller Scholarship

Relevant Coursework: Algorithms, Data Structures, Graph Theory, Applied Linear Algebra, Discrete Mathematics, Systems Programming, Computer Architecture, Computer Networks, Theory of Computing, Mathematical Analysis, Software Engineering, Software Development

Technical Skills

Programming Languages (Proficient): Java, Python, C

Programming Languages (Familiar): TypeScript, JavaScript, SQL, C++, HTML/CSS, LaTeX

Cloud & Developer Tools: Azure (App Service, Functions, ACI), Git, GitHub Actions (CI/CD), Docker, Linux, Bash

Frameworks & Libraries: React, Node.js, Express, Supabase (Postgres RLS), Playwright, NumPy, Pandas, PyTorch

Data & Protocols: REST APIs, MySQL, PostgreSQL, JSON, Gson, MSAL/Azure AD Auth

Human Languages: Proficient: Spanish | Intermediate: French, Chinese | Conversational: German, Russian, Korean

Experience

Fetch Freight

May 2026 – Present

Software Engineering Intern

Birmingham, AL

- Shipped 12 production web apps and serverless services (TypeScript, React, Node.js, Azure), including an AI document engine (Claude Vision) processing 300+ daily invoices and draining a 10-day backlog
- Engineered event-driven Azure Functions and Playwright/Docker browser workers for portal syncs and real-time SMS alerts, utilizing atomic claim-before-send ledgers to eliminate duplicate sends
- Strengthened platform security by designing signed single-use capability tokens for unauthenticated workflows, enforcing Postgres Row-Level Security, and resolving a vendor link flaw exposing internal data
- Reverse-engineered legacy SQL reports into modern web applications with custom parity-check harnesses to reduce TMS database load, while establishing heartbeat alerting to eliminate silent failures

AI4STEM (VIPR Program)

August 2025 – December 2025

Undergraduate Research

Athens, GA

- Researched LLM automated assessment models, sourcing benchmark datasets and designing a multimodal rubric integrating text and image data
- Developed Python data pipelines to process spreadsheet metrics into structured JSON, hitting the OpenAI API to generate automated, reasoning-based grading scores
- Evaluated LLM system performance using Cohen's Kappa, achieving 0.66-0.69 (substantial agreement) across 3 trials correlating model outputs against human teacher scores; presented findings at the CURO Symposium

Projects

LinguaPath – AI Language Learning Platform | *Next.js, TypeScript, Supabase, Vercel AI SDK* Summer 2026

- Architected and launched a bilingual Spanish/French platform (CEFR A1–C2) integrating graded reading, interactive games, SM-2 vocabulary drills, and real-time multiplayer features
- Designed a behavioral interest engine using event logging, time-decay scoring, and promotion thresholds to dynamically shape user profiles and personalize AI tutor interactions
- Integrated multi-provider AI pipelines (Gemini, Groq, GPT-4o-mini, ElevenLabs) featuring real-time streaming tutor chat, personality mirroring, and strict Zod schema validation
- Optimized production systems and spend using Supabase RLS, Realtime multiplayer channels, automated content ingestion tools, and feature-flag kill switches for cost-gated soft launching

Cinema E-Booking System | *React, TypeScript, Flask, MySQL, Docker*

Spring 2026

- Engineered a full-stack cinema platform handling end-to-end user workflows, including dynamic seat selection, payment processing, promotional discount validation, and automated email receipts
- Architected a modular Flask REST API and MySQL database using OOP design patterns (Facade, Adapter) to decouple payment and admin subsystems, containerized via Docker Compose for seamless environment parity
- Developed in an Agile environment across multi-week sprints, actively participating in sprint planning, backlog grooming, and peer code reviews to deliver features iteratively
